AN INTERACTIVE MATHEMATICS LABORATORY

MathXplore

See. Change. Code.

A browser-based lab where students **see** a function, **change** it with a slider, **predict** what happens next — and write the **Python** that draws it. Mathematics and programming, finally taught together.

TEAM Member 1 · Member 2 · Member 3
SUPERVISOR Supervisor name — FROM Faculty / school, institution

$z = \sin(\sqrt{(x^2 + y^2)} - t)$
live on the landing page — drag to rotate

5 Explore modules — from lines to 3D and geometry
12 What If? scenarios — predict first, then see
6 levels of Python — taught through maths
12 challenges graded — by running the code
182 automated checks — all passing
0 internet or accounts — needed to run

★ THE WOW

Four things to try in 60 seconds

Ask us for the keyboard.

01 Drag a slider
The parabola, its vertex and roots move — and **the Python beside it rewrites itself**.
`a, b, c = -1, 0, -3`

02 Predict first
"What if a goes from 1 to −1?" **Commit to an answer**, then watch the curve move against a ghost of the old one.
`ghost → reveal`

03 Make the classic mistake
Type `y = 2x + 3`. Instead of "invalid syntax", **the lab explains the maths**: $2x$ means $2 \times x$, and Python needs `2*x`.
`Missing multiplication sign`

04 Switch the wifi off
Airplane mode on — **everything keeps working**. No account, no download, nothing sent anywhere.
`offline — still running`

01 THE PROBLEM

Maths and code, taught apart

Two subjects, no bridge
Loops learnt on arbitrary examples; graphs never linked to code.

Answers without understanding
A calculator answers only what you already knew how to ask.

Errors that teach nothing
`SyntaxError: invalid syntax` is a dead end for a beginner.

02 OUR IDEA

Every Python concept arrives because a piece of mathematics needs it — and every picture on screen is also a program.

MATHEMATICS $y = ax^2 + bx + c$ ⇄ PICTURE ⇄ PYTHON

```
y = a*x**2
  + b*x + c
```

One learning loop, lit up on every working screen

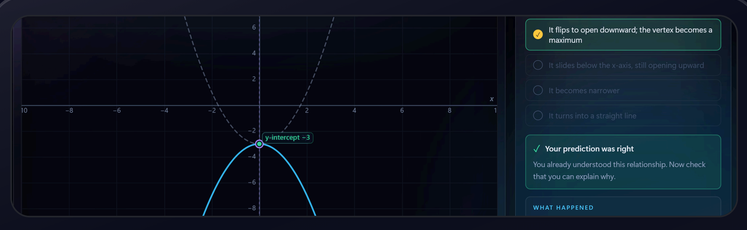

so a student always sees where they are — and that there is a next step

LEARN — 6-level pathway
EXPLORE — 5 modules
PREDICT — What If?
CHANGE — live sliders
VISUALISE — 2D · 3D
CODE — CodeLab
TEST — challenges
UNDERSTAND — error lessons
CREATE — sandbox · shapes

03 INSIDE THE LAB

Real screens, real mathematics

Every image is captured from the working system — nothing is mocked up.

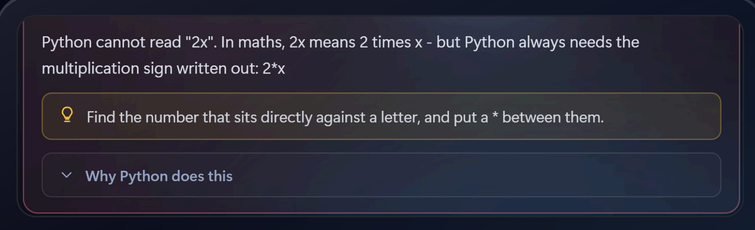

What If? — predict, then see

Students commit to a prediction before anything moves. Then the curve animates against a ghost of the old one, and the lab explains why it changed.

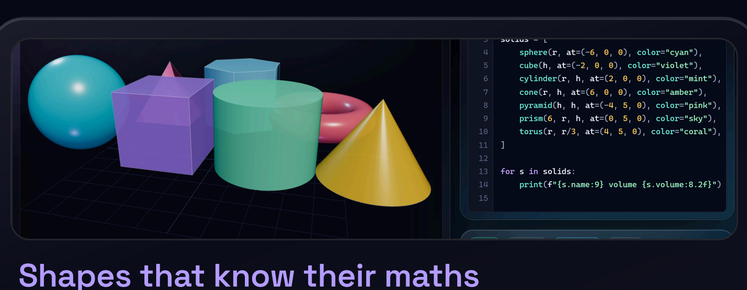

Every curve is also a program

Write Python, press Run, get mathematics back: **code → data → graph**, drawn on as you watch.

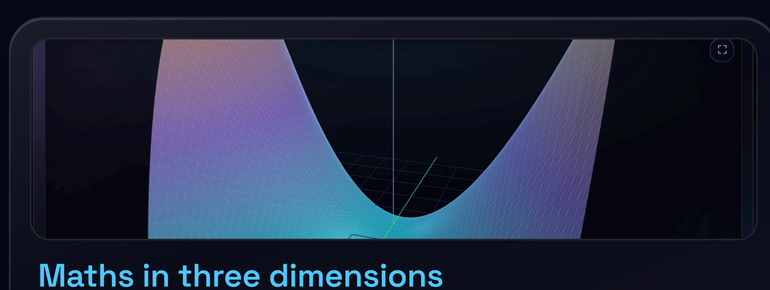

Mistakes become lessons

Type `y = 2x + 3` and the lab explains that maths allows $2x$ but Python needs `2*x` — with a hint that stops short of the answer.

Shapes that know their maths

`from shapes import *` — polygons, solids and turtle graphics. **Every shape reports its area, perimeter and volume** live.

Maths in three dimensions

Rotate $z = a(x^2 - y^2)$, then slice it: **every cross-section is an ordinary 2D curve**, drawn alongside.

Graded by running the code

Answers are run, not text-matched, so **any correct solution passes**. The student's function is drawn over the goal.

04 WHAT MAKES IT NEW

● yes ◐ partly / some products ○ no — n/a

	GRAPHING APPS	ONLINE PYTHON EDITORS	MATHXPLORE
Change maths live, in 2D and 3D	●	○	●
Python tied to the maths on screen	◐	◐	●
Predict-then-reveal, built in	◐	○	●
Errors explained in maths terms	—	○	●
Offline · no account · no data sent	◐	○	●

05 IMPACT

Students
Understanding over memorising: every change is predicted, seen and explained.

Teachers
Ready demonstrations, plus a class view built from students' real exported records.

Low-connectivity schools
Runs from one laptop or a school intranet — no internet needed after setup.

Evidence-ready
No effect claimed yet — anonymous on-device logs are ready for a pre/post-test study.

06 MARKET & NEXT STEPS

WHO	Upper-secondary & pre-university students, teachers, tutors
MODEL	Free for students · school licence · offline school kit
COST	Static files, no server — near-zero cost per extra student
NEXT	School pilot (pre/post-test) · Bahasa Melayu UI · authoring

07 UNDER THE HOOD

`your Python` → `parser` → `interpreter` → `graphs · shapes · lessons`

- ✓ Own Python engine, zero dependencies
- ✓ No `eval`, no network, no file access
- ✓ Runaway loops stopped safely
- ✓ React · TypeScript · Three.js
